

## Expt Neutralization titration

- 1) Standardization of an acid at bare dilution of the solution
- 2) Determine of the concentration of commercial phosphoric Acid & H<sub>3</sub>PO<sub>4</sub> using NaOH using different indicators

\* In Amy titration we have:-

1) Analyte

2) Titrant

↳ in this expt-

3) Indicator

1) The analyte is H<sub>3</sub>PO<sub>4</sub>

4) Equivalent point: N<sub>Acid</sub> = N<sub>base</sub> 2) Titrant is NaOH (Secondary standard)

5) end point

3) indicator chosen according to pH of H<sub>3</sub>PO<sub>4</sub>

4) we have 3 equivalent point due to we have 3 protons (H<sub>3</sub>PO<sub>4</sub>)

↳ The indicators used in Neutralization titration depends on pH of the titrant

Indicators	pH range	Color change (Acid → Base)
Methyl orange	3 - 5	yellow to red
Pheno cresol green	3.8 - 5.4	yellow to blue
phenol pethalim	8.2 - 10	colorless to pink

↳ Neutralization titration involves acid base titration in which end point detected by abrupt change in pH @ eq. point

N<sub>a</sub>CO<sub>3</sub> Standardization → HCl Standardisation → NaOH titration → H<sub>3</sub>PO<sub>4</sub>

Kinney standard

\* Secondary

\* it absorbs

→ Analyte (H = ??)

\* high stability

Standard

water (hydroscopic)

\* high solubility

\* we can't prepare

\* high m.w.

only accurate conc

\* not hygroscopic

Sol. by weight

\* Primary standard is more stable than Secondary standard.

↳ we use Standardization (as titration)

to know the main conc of titrant!!!

↳ To prepare primary standard:  $M = \frac{m}{M_w}$

↳ exact vol. of distilled water

$M = \text{mass}$   
 $m_w$

\* pH of AgNO<sub>3</sub>  $\Rightarrow$   $pH_1 = 4.6$  (in dilute soln)  $\Rightarrow$  6

(because  $pH_2 = 9.7$ )  $\Rightarrow$   $\Delta pH = 9.7 - 4.6 = 5.1$   $\Rightarrow$  5.1 mol/l dilute soln

$\therefore M_w \cdot pH_2 = 19.6$   $\Rightarrow$  19.6 mol/l

∴ 1 mol/l dilute soln  $\Rightarrow$  1 mol/l

(exact volume of water)
