# 1 Techniques and Measurements

Name: Dina'a Khaled Abu Jame' Section ..... 6 .....

Lab. Instructor ..... Date .....

## Pre-Laboratory Questions

1. A metal sphere weighing 15.45 g is added to 21.27 mL water in a graduated cylinder. The water level rises to 24.78 mL. Calculate the density of the metal.

$$\text{the volume of sphere} = V_{\text{after}} - V_{\text{before}} = 24.78 - 21.27 = 3.51 \text{ mL}$$
$$\text{density} = \frac{\text{mass}}{\text{volume}} \Rightarrow d = \frac{15.45}{3.51} = 4.40 \text{ g/mL}$$

2. An empty beaker weighs 32.4257 g. A 10.00 mL sample of unknown liquid is transferred to the beaker. The total mass of the beaker and liquid sample was 40.1825 g. Calculate the density of the unknown liquid.

$$\text{the mass of liquid} = 40.1825 - 32.4257 = 7.7568 \text{ g}$$
$$\text{density} = \frac{\text{mass}}{\text{volume}} \Rightarrow \text{density} = \frac{7.7568}{10.00} = 0.77568 \text{ g/mL}$$

3. A term that is easily confused with density is **specific gravity**. What is meant by specific gravity? What are the units of specific gravity?

$$\text{Specific gravity} = \frac{\text{density}}{\text{water density}} \quad \text{Unit: Less than 1}$$

## Results and Calculation

### A. Determination of the Density of Pure Liquid

|                                 | Trial (1)          | Trial (2)          |
|---------------------------------|--------------------|--------------------|
| Mass of beaker                  | $30.84 \pm 0.01$ g | $30.85 \pm 0.01$ g |
| Mass of beaker + water          | $40.72 \pm 0.01$ g | $40.78 \pm 0.01$ g |
| Mass of water                   | $9.88 \pm 0.01$ g  | $9.93 \pm 0.01$ g  |
| Volume of water                 | 10 mL              | 10 mL              |
| Temperature of water            | $24^\circ\text{C}$ | $25^\circ\text{C}$ |
| Density                         | 0.988 g/mL         | 0.993 g/mL         |
| Average density                 | 0.9905 g/mL        |                    |
| Handbook density                | 0.99707 g/mL       |                    |
| ID number of unknown liquid     |                    |                    |
| Mass of beaker                  | $30.83 \pm 0.01$ g | $30.85 \pm 0.01$ g |
| Mass of beaker + unknown liquid | $40.03 \pm 0.01$ g | $40.05 \pm 0.01$ g |
| Mass of unknown liquid          | $9.22 \pm 0.01$ g  | $9.2 \pm 0.01$ g   |
| Volume of unknown liquid        | 10 mL              | 10 mL              |
| Density of unknown liquid       | 0.92 g/mL          | 0.92 g/mL          |

## B. Density of Solutions

|                           | Trial (1) | Trial (2) |
|---------------------------|-----------|-----------|
| Mass of beaker            | g         | g         |
| Volume of solution        | mL        | mL        |
| Mass of beaker + solution | g         | g         |
| Mass of solution          | g         | g         |
| Temperature of solution   | °C        | °C        |
| Density of solution       | g/mL      | g/mL      |

## C. Density of Solids

|   | Trial (1)          | Trial (2)          |
|---|--------------------|--------------------|
| Mass of beaker                                | $60.65 \pm 0.01$ g | $60.65 \pm 0.01$ g |
| Mass of beaker + solid pieces                 | $63.83 \pm 0.01$ g | $65.79 \pm 0.01$ g |
| Mass of solid pieces                          | $3.18 \pm 0.01$ g  | $5.14 \pm 0.01$ g  |
| Initial water level in the graduated cylinder | 50 mL              | 50 mL              |
| Final water level in the graduated cylinder   | 51 mL              | 52 mL              |
| Volume of solid pieces                        | 2 mL               | 2 mL               |
| Density of the solid substance                | 3.18 g/mL          | 2.57 g/mL          |

## Questions:

- What error would be introduced into the density of the metal pellets if you had not shaken the pellets to remove adhering air bubbles? Would the density be too high or too low?

If we had not shaken the pellets, there would be air bubbles  $\rightarrow$  the volume increases  $\rightarrow$  the density would be too low than the true density (density = mass / volume)

- The density of diamond is  $3.51 \text{ g/cm}^3$  and the density of lead is  $11.3 \text{ g/cm}^3$ . If equal masses of diamond and lead were transferred to equal volumes of water in graduated cylinders, which graduated cylinder would have the highest volume reading? Explain.

$$\begin{aligned}d_d &= 3.51 \text{ g/cm}^3 & d_l &= 11.3 \text{ g/cm}^3 & \text{mass}_d &= \text{mass}_l \\d_l &> d_d & & & \text{V}_w \text{ are same for both} \\&\text{mass}_l > \text{mass}_d \quad \text{but} \quad \text{mass}_d = \text{mass}_l & & & \text{d}_d \\V_{w+l} &< V_{w+d} & & & \\V_w + V_l &< V_w + V_d & & & \\V_{\text{lead}} &< V_{\text{diamond}} & & & \end{aligned}$$

## 2 Formula of a Hydrate

Name: .....

Section .....

Lab. Instructor .....

Date .....

### Pre-Laboratory Questions

1. What are alums? Give examples other than potassium alum.

Alums are a class of hydrates, consist of a double salt with the general formula  $(M^+M''(SO_4)_2 \cdot xH_2O)$ .  $M^+$ : univalent cation  $M'''$ : a trivalent cation.

2. What are the hydrates? Give few examples of metal salt hydrates.

Hydrate is a compound that has crystallized from a aqueous solution with weakly bound water molecules contained in the crystal. They could be transition metal salts as  $CuSO_4 \cdot 5H_2O$  or a polyatomic transition metal salt as  $Na_2[Fe(C_2O_4)_3] \cdot 3H_2O$  or a covalent

3. Potassium ferric alum has the formula:  $KFe(SO_4)_2 \cdot xH_2O$ . A sample of

1.26 g of this alum was heated in a crucible to get a constant mass.

The mass of the anhydrous salt produced ( $KFe(SO_4)_2$ ) was 0.72g.

Calculate the value "x" in the formula of the alum.

$$\text{mass of water} = 1.26 - 0.72 = 0.54 \text{ g} \Rightarrow \frac{\# \text{ mole of } H_2O}{1.8} = \frac{0.54}{1.8} = 0.03 \text{ mol}$$

$$\# \text{ mole of anhydrous} = \frac{0.72}{287} = 2.5 \times 10^{-3} \text{ mol}$$

$$x = \frac{\# \text{ mole of water}}{\# \text{ moles of anhydrous}} = \frac{0.03}{0.0025} = 12$$

## 2 Formula of a Hydrate

### Results and Calculations

#### A. Potassium Alum:

|   |   |
|---|---|
| Mass of empty crucible ( $m_1$ )  | $18.73 \pm 0.01$ g  |
| Mass of crucible and the alum ( $m_2$ )   | $19.76 \pm 0.01$ g  |
| Mass of crucible and anhydrous salt ( $m_3$ )   | $19.30 \pm 0.01$ g  |
| Mass of alum ( $m_2 - m_1$ )  | $1.03 \pm 0.01$ g   |
| Mass of anhydrous salt ( $m_3 - m_1$ )  | $0.57 \pm 0.01$ g   |
| Mass of water lost upon heating ( $m_2 - m_3$ )   | $0.46 \pm 0.01$ g   |
| Number of moles of water lost upon heating  | $\frac{m_2 - m_3}{18} = 0.03$ mol   |
| Number of moles of anhydrous salt ( $KAl(SO_4)_2$ )   | $\frac{m_3 - m_1}{258} = 2.2 \times 10^{-3}$ mol  |
| Percentage of water of crystallization, by mass   | $\frac{m_2 - m_3}{m_2 - m_1} \times 100\% = 44.66\%$ %                                  |
| The value 'x' in the formula, (number of moles of water of crystallization / number of moles of anhydrous salt) | $\frac{\# \text{ mole of } H_2O}{\# \text{ mole of anhydrous salt}} = 1.63 \approx 1.6$ |

# mole of anhydrous

## B. Unknown Hydrate:

Unknown number: \_\_\_\_\_  
Mass of crucible ( $m_4$ )  $18.73 \pm 0.01$  g

|  |                    |
|--|--------------------|
| Mass of crucible and the hydrate ( $m_5$ )                                       | $19.75 \pm 0.01$ g |
| Mass of crucible and anhydrous salt ( $m_6$ )                                    | $19.32$ g          |
| Mass of <del>anhydrous</del> salt ( $m_5 - m_4$ )                                | $1.03 \pm 0.01$ g  |
| Mass of water lost upon heating ( $m_5 - m_6$ )                                  | $0.43 \pm 0.01$ g  |
| Percentage of water of crystallization, by mass<br>$\frac{m_5 - m_6}{m_5 - m_4}$ | $41.74$ %          |

14.80

## QUESTIONS:

1. What is the effect on the calculated value of "x" if the dehydration of the alum is not complete

If dehydration is not complete  $\Rightarrow$  mass of water loss  $\downarrow$   
 $\Rightarrow$  # moles of  $H_2O \downarrow \Rightarrow X \downarrow$  (decrease)  
 $X = \frac{\# \text{ moles of } H_2O}{\# \text{ mole of anhydrite}}$

2. A student heated 1.40 g of hydrated nickel(II) sulfate in a crucible to get 0.77 g of anhydrous salt. What is the formula of the salt? (show your work)

$$\text{mass of } H_2O = 1.40 - 0.77 = 0.63 \text{ g} \Rightarrow \text{mole} = \frac{0.63}{18}$$
$$\# \text{ mole of anhydrite} = \frac{0.77}{164.7} = 4.9 \times 10^{-3} \text{ mol}$$

$$X = \frac{\# \text{ mole of } H_2O}{\# \text{ mole of anhydrite}} = \frac{0.035}{4.9 \times 10^{-3}} = 7.14 \approx 7$$

# 3 The Empirical Formula of an Oxide

## Pre-Laboratory Questions

- What is the mole and molar mass? What are the molar masses of magnesium and atomic oxygen?

~~The mole is the quantity of a given substance that contains a many molecules or formula units as the number of atoms in exactly 12 g carbon-12 = Avogadro's number =  $6.022 \times 10^{23}$~~

~~The molar mass of a substance is the mass of one mol of the substance.~~

- When 0.192 g of phosphorus is burned, 0.440 g of a white oxide is obtained.  
(a) Write a balanced chemical equation for the reaction of Phosphorus with molecular oxygen based on this empirical formula. (b) Determine the empirical formula of the oxide.

$$\text{mass of } O_2 = 0.440 - 0.192 = 0.248 \text{ g} \quad | \quad \# \text{mole of } O_2 = \frac{0.248}{32} = 0.00775 \text{ mol}$$

$$\# \text{mole of } P = \frac{0.192}{30.9} = 6.21 \times 10^{-3} \text{ mol}$$
$$\frac{0.0155}{0.00621} \quad \frac{0.00621}{0.00621}$$

$$(2.49 : 1) 2$$

$$5 : 2$$

| Mass of empty crucible (average) $m_1$   | $19.25 \pm 0.01$ g       |
| Mass of crucible and Mg $m_2$  | $19.45 \pm 0.01$ g       |
| Mass of Mg $m_2 - m_1$   | $0.2 \pm 0.01$ g         |
| Moles of Mg $\frac{m_2 - m_1}{24.3}$ (24)  | $8.3 \times 10^{-3}$ mol |
| Mass of crucible and Mg-oxide (after first heating) $m_3$  | $19.57 \pm 0.01$ g       |
| Mass of crucible and Mg-oxide (after second heating) $m_3'$  | $19.55 \pm 0.01$ g       |
| Mass of crucible and Mg-oxide (average) $m_3$  | $19.56 \pm 0.01$ g       |
| Mass of Mg-oxide produced $m_3 - m_1$  | $0.31 \pm 0.01$ g        |
| Mass of oxygen gained $(m_3 - m_1) - (m_2 - m_1) = m_3 - m_2$  | $0.11 \pm 0.01$ g        |
| Moles of oxygen $\frac{m_3 - m_2}{15.99}$  | $6.8 \times 10^{-3}$ mol |
| Empirical formula of the oxide   | Mg O                     |
| Mass percent of Mg in the oxide ( $x_1$ ) (Experimentally)<br>$\frac{m_2 - m_1}{m_3 - m_1} \times 100\%$ | 64.52 %                  |
| Mass percent of Mg in the oxide ( $x_2$ ) (calculated for<br>MgO) $\frac{24}{40}$                        | 60 %                     |
| Percentage error = $(x_2 - x_1)/x_2 \times 100\%$  | 7.53%                    |

$$m_2 - m_1 = 0.2 \text{ g}$$

$$m_3 - m_1 = 0.11 \text{ g}$$

$$\% \text{Mg} = \frac{\text{mass Mg}}{\text{mass MgO}}$$

## QUESTIONS:

1. If water had not been added to your initial product, what error in the determined percentage of magnesium would have resulted (that is, if part of the product has been magnesium nitride)? Explain.

If water had not been added  $\rightarrow$  a part of the product would be  $\text{Mg}_3\text{N}_2$   $\rightarrow$  mass of  $\text{MgO}$  would be bigger  $\rightarrow$  percentage of magnesium would decrease  
 $\% \text{Mg} = \frac{\text{mass Mg}}{\text{mass MgO}}$   $\Rightarrow \% \text{Mg} \uparrow$   $\rightarrow$  increase

2. If large amount of magnesium oxide had been lost during the heating of the crucible, would this have made the calculated %Mg in the product too high or too low? Explain.

$$\text{MgO} \downarrow \quad \% \text{Mg} = \frac{\text{Mass of Mg}}{\text{Mass of MgO}}$$

$\Rightarrow \% \text{Mg}$  too high would be constant because decreasing in  $\text{MgO}$  include decreasing in Mg.

## Pre-Laboratory Questions

1.  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$  and  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$  are examples of compounds known as hydrates. What are the hydrates? Give other examples of hydrates.

Hydrate is a compound that has crystallized from aqueous solution with weakly bound water molecules contained in the crystal.

Examples:  $\text{Na}_2\text{C}_2\text{H}_3\text{O}_2 \cdot 3\text{H}_2\text{O}$ ,  $\text{KAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$

2. A mixture of 0.65 g  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$  and 0.35 g  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$  was dissolved in water. Which of the two reactants is the limiting reactant?

Calculate the mass of  $\text{Ba}_3(\text{PO}_4)_2$  precipitate formed.

$$0.65\text{ g BaCl}_2 \times \frac{1\text{ mol BaCl}_2 \cdot 2\text{H}_2\text{O}}{248.2\text{ g BaCl}_2} \times \frac{3\text{ mol Ba}_3(\text{PO}_4)_2}{3\text{ mol BaCl}_2} = 8.9 \times 10^{-4} \text{ mol (Ba}_3(\text{PO}_4)_2)$$

$$0.35\text{ g Na}_3\text{PO}_4 \times \frac{1\text{ mol Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}}{380.2\text{ g Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}} \times \frac{1\text{ mol Ba}_3(\text{PO}_4)_2}{2\text{ mol Na}_3\text{PO}_4} = 4.6 \times 10^{-4} \text{ mol Ba}_3(\text{PO}_4)_2$$

$\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$  is the limiting reactant.  
 $\text{Na}_3\text{PO}_4$

$$\text{the Ba}_3(\text{PO}_4)_2 \text{ mass} = 4.6 \times 10^{-4} \text{ mol} \times \frac{601.9}{1\text{ mol}} = 0.277\text{ g}$$

# 4 Limiting Reactant

Name: .....

Section .....

Lab. Instructor .....

Date .....

## Results and Calculations

### A. Precipitation of $\text{Ba}_3(\text{PO}_4)_2$ :

Unknown Number: 15

|   |                   |
|---|-------------------|
| Mass of salt mixture ( $m_1$ )                                  | $1.00 \pm 0.01$ g |
| Mass of filter paper ( $m_2$ )                                  | $0.40 \pm 0.01$ g |
| Mass of filter paper and $\text{Ba}_3(\text{PO}_4)_2$ ( $m_3$ ) | $0.62 \pm 0.01$ g |

### B. Determination of the Limiting Reactant:

Limiting reactant in salt mixture is  $\text{BaCl}_2$

Excess reactant in salt mixture is  $\text{Na}_3\text{PO}_4$

|   |                           |
|---|---------------------------|
| Mass of $\text{Ba}_3(\text{PO}_4)_2$ precipitated ( $m_3 - m_2$ ) | $0.22 \pm 0.01$ g         |
| Number of moles of $\text{Ba}_3(\text{PO}_4)_2$ ( $n_1$ )         | $3.66 \times 10^{-4}$ mol |

(a) If the limiting reactant is  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ :  $n_2 = 3n_1$

|  |                            |
|--|----------------------------|
| Number of moles of $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ reacted ( $n_2$ ) | $1.098 \times 10^{-3}$ mol |
| Mass of $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ reacted ( $m_4$ )            | $0.27 \pm 0.01$ g          |

$$n_2 \times 244.2$$

$2 \rightarrow 1$

v

380.2

(b) If the limiting reactant is  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ .

$$n_3 = 2n_1$$

|  |                         |
|--|-------------------------|
| Number of mole of $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ reacted( $n_3$ ) | moles                   |
| Mass of $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ reacted( $m_5$ )           | $\pm 0.01\text{g}$      |
| Mass of salt mixture( $m_1$ )  | $1.00 \pm 0.01\text{g}$ |

(c) Mass percent calculation.

|   |   |
|---|---|
| Mass of excess reactant $m_1 - m_4$<br>(Depending on which reactant is the limiting reactant) | $0.73 \pm 0.01\text{ g}$                    |
| Mass percentage of $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ in the mixture                   | $\frac{m_4}{m_1} \times 100\% = 27\%$       |
| Mass percentage of $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ in the mixture         | $\frac{m_1 - m_4}{m_1} \times 100\% = 73\%$ |

$$\frac{m_5}{m_1} \times 100\% \rightarrow \frac{m_1 - m_5}{m_1} \times 100\% \quad \text{Path}_1$$

g  
mol

## QUESTIONS:

1. Calculate the mass of  $\text{Ba}_3(\text{PO}_4)_2$  produced from the reaction of 0.85 g  $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$  with excess  $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ . What is the purpose of heating the mixture in step 3 for 20 minutes?

$$0.85 \text{ g Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O} \times \frac{1 \text{ mol Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}}{1 \text{ mol Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}} \times \frac{1 \text{ mol Ba}_3(\text{PO}_4)_2}{2 \text{ mol Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}} \times \frac{6 \text{ mol NaCl}}{1 \text{ mol Ba}_3(\text{PO}_4)_2} = 0.67 \text{ g NaCl}$$

The purpose of heating is to increase the size of precipitation particles so that they can be separated from the solution in the filtration.

2. What is the purpose of washing the precipitate with hot water in step 4? How would the reported percentage of the excess reactant be affected if the precipitate was not washed in this step?

To collect the whole amount of the precipitate of the beaker and the funnel.

If the precipitate was not washed  $\rightarrow$  the mass of  $\text{Ba}_3(\text{PO}_4)_2$  will be less than the true one  $\rightarrow$  m<sub>1</sub>  $\rightarrow$  (missing reagent)  $\rightarrow$  the excess reactant ↑  $\rightarrow$  the excess percentage increases.

## Pre-Laboratory Questions

1. Why was the standard NaOH solution not prepared by calculating

NaOH reacts with water to form NaOH(aq). If we weighed the solid NaOH and dissolved it in water, the volume of the solution would change because the density of the solution would change. Therefore, we cannot accurately weigh the solid NaOH and dissolve it in water to make a standard NaOH solution.

that is, if we add water to NaOH, some will be lost at the end point which is more accurate.

2. Why not simply rinse the buret with distilled water rather than the solution to be used in it?

to avoid that there is distilled water from the buret wall.

3. Why does the volume of water added to potassium hydrogen phthalate not have to be measured carefully?

because we don't need to calculate the volume of water. The most important is the presence of KHP to limit the end point. Then the volume of NaOH we need (the number of moles is the same, KHP is very pure).

doesn't change by changing the volume.

$$1 \text{ L} = 1000 \text{ mL} = 1000 \text{ g} \Leftrightarrow \text{density is } 1.00$$

$$\cancel{\gamma \text{Mass}} = \cancel{\frac{0.0115}{1000}} \times 100\% =$$

## QUESTIONS:

1. Calculate the percent error would have been in a titration that used 26.65 mL of a solution if a bubble with a volume of 0.30 mL had been swept out of the tip during the titration.

$$26.65 - 0.30 = 26.35$$

$$\text{percent error} = \frac{0.30}{26.35} \times 100\% = 1.14\%$$

2. If a solution is diluted, the same number of moles of reagent is still present. Hence, it is possible to calculate a new volume or a new molarity from a known greater molarity. The equation is:  $M_1V_1 = M_2V_2$ . If you wish to make 500 mL of a 0.20 M solution of a reagent from 1.5 M solution, how much of the latter solution would you use?

$$M_1V_1 = M_2V_2$$

$$0.20 \times 0.5 = 1.5 \times V_2$$

$$V_2 = 0.0667 L = 66.7 \text{ mL}$$

# 6 The Neutralizing Capacity of Antacid Tablets

Name: .....

Section .....

Lab. Instructor .....

Date .....

## Pre-Laboratory Questions

1. Write a balanced equation for the reaction of HCl and NaHCO<sub>3</sub>

2. How many moles of HCl are needed to react with 0.35 g of NaHCO<sub>3</sub>?

$$0.35 \text{ g NaHCO}_3 \times \frac{1 \text{ mol NaHCO}_3}{84.01 \text{ g NaHCO}_3} \times \frac{1 \text{ mol HCl}}{1 \text{ mol NaHCO}_3} = 4.2 \times 10^{-3} \text{ mol HCl}$$

3. Why we do not use strong bases as active ingredients of antacid tablet?

\* Because the decreasing in pH wouldn't be so large so we add weak bases. Also using strong bases  $\rightarrow$  pH increases more than 7. But we need pH = 5.4 approximately in the stomach because NaOH is caustic.

| Average (mol HCl/g antacid)                           | 0.0331 mol HCl/g antacid                               |                           |

## QUESTIONS:

1. Assume the concentration of stomach acid is 0.10M and the neutralizing capacity of the acid is 0.011 mol/g. Calculate the volume of stomach acid needed to neutralize 1.0 g antacid tablet.

$$\begin{aligned} \text{moles HCl} &= 0.011 \\ \text{g antacid} & \\ \text{moles HCl} &= 0.011 = 0.011 \text{ mol HCl} \\ & \\ & M = \frac{\text{moles}}{\text{V}} \\ 0.10 &= \frac{0.011}{\text{V}} \\ \text{V} &= 0.11 \text{ L} \\ & \\ & 0.04 \text{ L} \end{aligned}$$

2. A student dissolves 0.353 g sample of antacid in 40.00 mL of 0.141 M HCl solution, then back-titrated to the end-point with 8.92 mL of a 0.203 M NaOH solution.

- a) Calculate number of moles of acid in the original 40.00 mL of HCl?

$$\begin{aligned} \text{moles of HCl} &= M \times V \\ &= 0.141 \times 40 = \\ & \quad 1000 \\ &= (5.64 \times 10^{-3}) \text{ moles HCl} \end{aligned}$$

- b) How many moles of base were used in the back-titration of excess HCl?

$$\begin{aligned} \text{moles of NaOH} &= M \times V \\ &= 0.203 \times 8.92 = 1.81 \times 10^{-3} \\ & \quad 1000 \end{aligned}$$

- c) How many moles of excess HCl?

$$\begin{aligned} \text{moles of excess HCl} &= \text{moles of NaOH} \\ &= 1.81 \times 10^{-3} \text{ mol HCl} \end{aligned}$$

# 7 Vitamin C Analysis

Name: .....

Section .....

Lab. Instructor .....

Date .....

## Pre-Laboratory Questions

1. Explain why cooked fruits and vegetables have lower vitamin C content than fresh fruits and vegetables.

Because cooking ~~wetting~~ leaches water soluble vitamin C from the vegetable  
high temperature accelerates its degradation by air oxidation

2. What are the oxidizing agents in this experiment?

3. What will be the color change of the starch indicator that indicates the end of the titration in this experiment?

dark blue  $\rightarrow$  colourless

4. Vitamin C is an acid (ascorbic acid) and a reducing agent. Which property is utilized for this analysis in this experiment?

Reducing agent

5. If 29.57 ml of a vegetable juice contains 35% of the recommended daily allowance of vitamin C (equal to 60 mg). How many milliliters of the vegetable juice will provide 100% of the recommended daily allowance?

$$29.57 \text{ ml} \rightarrow 35\%$$

$$? \text{ ml} \rightarrow 100\%$$

$$29.57 \text{ ml} \times \frac{100\%}{35\%} = 84.5 \text{ ml}$$

## QUESTIONS:

1. A 25.0 mL volume of 0.010 M  $\text{KIO}_3$ , containing an excess of KI, is added to a 0.246 g sample of a lemon solution containing vitamin C. The red brown solution, caused by the presence of excess  $\text{I}_3^-$ , is titrated to a colorless starch end point with 10.7 mL of 0.100 M  $\text{Na}_2\text{S}_2\text{O}_3$ .

a. How many moles of  $\text{KIO}_3$  were added to the lemon solution?

$$\# \text{ moles of } \text{KIO}_3 = V \times M$$

$$= 25.0 \cancel{\text{L}} \times 0.010 \cancel{\text{mol}} = 2.50 \times 10^{-4} \text{ mol}$$

b. Calculate the moles of  $\text{I}_3^-$  that are generated from  $\text{KIO}_3$ .

$$\frac{2.5 \times 10^{-4} \text{ mol } \text{IO}_3^- \times 3 \text{ mol } \text{I}_3^-}{1 \text{ mol } \text{IO}_3^-} = 7.50 \times 10^{-4} \text{ mol } \text{I}_3^-$$

c. How many moles of  $\text{I}_3^-$  reacted with the 0.100 M  $\text{Na}_2\text{S}_2\text{O}_3$  in the titration?

$$\# \text{ moles of } \text{Na}_2\text{S}_2\text{O}_3 = M \times V$$

$$= 0.100 \cancel{\text{L}} \times \frac{10.7 \cancel{\text{L}}}{1000 \cancel{\text{L}}} = 1.07 \times 10^{-3} \text{ mol } \text{Na}_2\text{S}_2\text{O}_3$$

$$\frac{1.07 \times 10^{-3} \text{ mol } \text{S}_2\text{O}_3^{2-} \times 1 \text{ mol } \text{I}_3^-}{2 \text{ mol } \text{S}_2\text{O}_3^{2-}} = 5.35 \times 10^{-4} \text{ mol } \text{I}_3^-$$

d. How many moles of  $\text{I}_3^-$  had reacted with the vitamin C in the lemon sample?

$$\# \text{ of moles of } \text{I}_3^- (\text{reacted}) = 7.50 \times 10^{-4} - 5.35 \times 10^{-4}$$

$$= 2.15 \times 10^{-4} \text{ mol } \text{I}_3^- \text{ reacted with } \checkmark \text{ the vitamin C}$$

e. Calculate the moles and grams of vitamin C in the sample.

$$\frac{2.15 \times 10^{-4} \text{ mol } \text{I}_3^- \times 1 \text{ mol } \text{C}_6\text{H}_8\text{O}_6}{1 \text{ mol } \text{I}_3^-} = 2.15 \times 10^{-4} \text{ mol } \text{C}_6\text{H}_8\text{O}_6$$

f. Calculate the percent (by mass) of vitamin C in the lemon sample.

$$\% \text{ Vitamin C} = \frac{0.0378}{0.246} \times 100\% = 15.4\%$$

2. If the blue color does not appear when the starch solution is added during the titration, should you continue titrating or discard the sample? Explain.

discard the sample because if the blue color does not appear, this means that there is no  $I_3^-$  in the solution which we need to determine the amount of vitamin C in the sample.

## Bleach Analysis

Name: .....

Section .....

Lab. Instructor .....

Date .....

## Pre-Laboratory Questions

1. Write balanced equation(s) for the reactions involved in standardization of sodium thiosulfate.

2. In today's chemical analysis of bleach solution, what substance is oxidized by the hypochlorite ion?

the stains (It removes the "excitable" electrons from the substance by the energy of the visible light)

3. What are the formulas of sodium thiosulfate and hypochlorite ion?

4. Does sodium thiosulfate serve as an oxidizing agent or as a reducing agent? What does sodium thiosulfate oxidize or (reduce)?

As a reducing agent

It reduces  $\text{I}_2$  to  $\text{I}^-$

It reduces  $\text{ClO}^-$  to  $\text{Cl}^-$

| Molarity of diluted bleach solution  | 0.0174 M                  | 0.0178 M                  |
| Molarity of original bleach solution                                       | 0.348 M                   | 0.356 M                   |
| Average molarity of original bleach solution                               | 0.352 M                   |                           |

## QUESTIONS:

$$\frac{100}{10} = 10 \text{ mL}$$

1. A 10.0 mL bleach sample is diluted to 100 mL in a volumetric flask. A 25 mL of this solution is analyzed according to the procedure in this experiment. If 11.3 mL of 0.30 M  $\text{Na}_2\text{S}_2\text{O}_3$  is needed to reach the stoichiometric point, calculate the mass percent of  $\text{NaClO}$  in the original sample? (Assume the density of bleach solution is 1.084 g/mL.)

$$\begin{aligned} \text{# mols. of } \text{Na}_2\text{S}_2\text{O}_3 &= M \times V \\ &= 0.30 \times \frac{11.3}{1000} = 3.39 \times 10^{-3} \text{ mol} \end{aligned}$$

$$\begin{aligned} \text{# mols. of ClO}^- &= \frac{3.39 \times 10^{-3}}{2} = 1.695 \times 10^{-3} \text{ mol} \end{aligned}$$

$$\begin{aligned} \text{Density} &= \frac{m}{V} & \text{# mols. of ClO}^- &= 1.695 \times 10^{-3} \times 1.0 = \\ \Phi. 084 &= \frac{m}{10} & M &= \frac{\text{# mols.}}{V} = \frac{1.695 \times 10^{-3}}{25 \times 10^{-3}} = 0.0678 \text{ M} \end{aligned}$$

$$\text{mass of bleach} = 27.9$$

$$1 \text{ mol NaClO} \times \frac{74.5 \text{ g NaClO}}{1 \text{ mol NaClO}} = 74.5 \text{ g NaClO}$$

$$M \rightarrow (10 \text{ mL}) = 0.0678 \times 10 = 0.678 \text{ M}$$

$$\text{density} = \frac{m}{V}$$

$$1.084 = \frac{m}{10.0 \text{ mL}} \Rightarrow m = 10.84 \text{ g} = 10.84 \text{ g}$$

$$\begin{aligned} \text{# mols. of (10.0 mL)} &= M_{10 \text{ mL}} \times V \\ &= 0.0678 \times \frac{10}{1000} = 6.78 \times 10^{-3} \text{ mol} \times \frac{74.5 \text{ g NaClO}}{1 \text{ mol NaClO}} \\ &= 0.505 \text{ g NaClO} \end{aligned}$$

$$\% \text{ NaClO} = \frac{0.505}{10.84} \times 100\% = 5.666\%$$

# 9 Molar Mass of a Volatile Liquid

Name: ..... Section .....

Lab. Instructor ..... Date .....

## Pre-Laboratory Questions

1. Dumas method assumes the gas behaves ideally, in general, when gases behave ideally?

when we have low pressure and high temperature

2. The vapor from an unknown volatile liquid occupies a 269 mL Erlenmeyer flask at 98.7 °C and 748 torr. The mass of vapor is 0.791 g.

- a) How many moles of vapor are present?

$$PV = nRT \quad T = 372 \text{ K} \quad P = 748 \text{ torr} \times \frac{101.315 \text{ kPa}}{748 \text{ torr}} = 101.315 \text{ kPa}$$
$$n = \frac{PV}{RT} = \frac{0.984 \text{ atm} \times 269 \text{ mL}}{0.08214 \text{ L atm/mol K}} = 8.68 \times 10^{-3} \text{ mol}$$

- b) What is the molar mass of the volatile liquid?

$$M = m/n$$

$$M = m/n = 0.791 \text{ g} / 8.68 \times 10^{-3} \text{ mol} = 91.3 \text{ g/mol}$$

- c) What is the density of vapor at STP?

$$P = 1 \text{ atm} \quad T = 273 \text{ K}$$

$$PV = nRT \Rightarrow \frac{V}{n} = \frac{RT}{P} = \frac{0.08214 \frac{\text{L atm}}{\text{K mol}} \times 273 \text{ K}}{1 \text{ atm}} = 22.4 \frac{\text{L}}{\text{mol}}$$

$$\text{molar mass} = 0.120 \text{ g/mol}$$

$$\text{molar volume} = 22.4 \text{ L/mol}$$

$$\text{density} = \frac{\text{mass}}{\text{volume}} = \frac{0.120 \text{ g/mol}}{22.4 \text{ L/mol}} = 5.36 \times 10^{-3} \text{ g/ml}$$

| Average molar mass                |                          | g/mol      |

$$PV = nRT$$

$$\frac{1}{\text{atm}} \times 0.17 \text{ L} = n \times 0.082 \text{ atm} \cdot \text{K}^{-1} \cdot \text{mol}^{-1} \times 363 \text{ K} \quad \text{Solve for } n$$

$$n = 5.71 \times 10^{-3} \text{ mol}$$

heat capacity of a known system before and after the dissociation

## QUESTIONS:

- If the outside of the flask is not dried after vaporizing the liquid, will the calculated molar mass be too high or too low? Explain.

If the outside of the flask is not dried after vaporizing the mass of the flask and condensed vapor ↑

n is the same molar mass

vapor

So that the molar mass will increase  
of polystyrene from 104 to 121 g/mol  
depends on how much water is left on the flask

- Consider the following data: Mass of condensed vapor = 0.495 g at 98 °C and 745 mm Hg occupies 127 mL. What is the molar mass of the liquid?

$$T = 98 + 273 = 371 \text{ K}$$

$$P = 745 \text{ mm Hg} \times \frac{1 \text{ atm}}{760 \text{ mm Hg}}$$

$$= 0.98 \text{ atm}$$

$$PV = nRT$$

$$0.98 \text{ atm} \times \frac{127 \text{ L}}{1000} \times \frac{1}{0.082 \text{ L} \cdot \text{atm}^{-1} \cdot \text{K}^{-1}} \times 371 \text{ K}$$

$$n = 9.09 \times 10^{-3} \text{ mol}$$

$$n = \frac{\text{mass}}{\text{molar mass}}$$

$$4.09 \times 10^{-3} = \frac{0.495 \text{ g}}{\text{molar mass}}$$

$$\text{molar mass} = 121.02 = 121 \text{ g/mol}$$

## Pre-Laboratory Questions

1. What is the definition of the *joule* in terms of the basic SI units?

$$w = F \cdot s \\ = N \cdot m = Joule$$

2. In a calorimeter calibration experiment, a sample of 51.203 g of water at  $55.2^{\circ}\text{C}$  is added to a calorimeter containing 49.783 g of water at  $23.5^{\circ}\text{C}$ . After stirring and waiting for the system to equilibrate, the final temperature reached is  $37.6^{\circ}\text{C}$ . Calculate the calorimeter constant.

$$\Delta_{\text{warm}} = q_{\text{heat}} + q_{\text{calorimeter}}$$

$$m \cdot s \cdot k \cdot \Delta t_{\text{warm}} = m \cdot s \cdot \Delta t_{\text{cold}} + C \cdot \Delta t_{\text{cold}}$$

$$51.203 \times 4.184 \times (55.2 - 37.6) = 49.783 \times 4.184 \times (37.6 - 23.5) + C \times (37.6 - 23.5)$$
$$3.77.0.5 = 2.936.9 + C \times 14.1 \rightarrow C = 59.1 \text{ J}/\text{C}^{\circ}$$

3. Give chemical equations for the reactions that will occur during this Experiment

4. The acids and bases to be used in this experiment are classified as strong acids or bases. Use your textbook to find what is meant by the word strong in this context.

completely ionized

## Questions:

1. What effect on the calculated calorimeter constant would be observed if the calorimeter cup were made of conducting material (such as metal) rather than plastic foam?

It will increase

$$q_{\text{vessel}} = q_{\text{calorimeter}} + q_{\text{calorimeter}}$$

~~conductivity~~  $\rightarrow q_{\text{vessel}} = q_{\text{calorimeter}} + q_{\text{calorimeter}} + q_{\text{calorimeter}}$

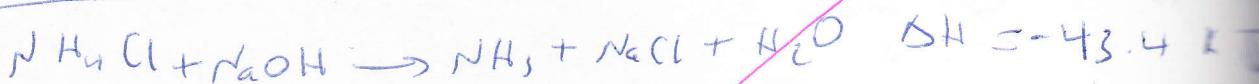

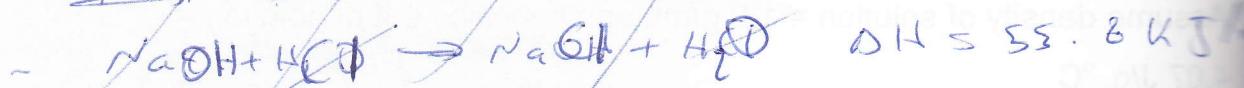

$\rightarrow q_{\text{calorimeter}}$  will be higher than before

$$q_{\text{calorimeter}} = C \cdot \Delta T \rightarrow C_{\text{calorimeter}}$$

2. Why is water typically used as the heat-absorbing liquid in calorimeter?

- ① Because its ~~high~~ specific heat which is
- ② constant for the temperature of reaction

3. Given that  $\Delta H$  for the reaction:  $\text{NH}_3 + \text{HCl} \rightarrow \text{NH}_4\text{Cl}$ , is -12.4 kJ/mol and the measured value of  $\Delta H$  for the  $\text{NaOH}/\text{HCl}$  reaction is -55.8 kJ, use Hess's law to calculate  $\Delta H$  for the reaction:

# 11 Molar Mass from Freezing Point Depression

Name: ..... Section .....

Lab. Instructor ..... Date .....

## Pre-Laboratory Questions

3. Define what we mean by the colligative property

a...solution characteristic depends only on the number of solute molecules in a given quantity of solvent...and don't depend on the nature or type of the solute

4. A 0.2436-g sample of an unknown substance was dissolved in 20.0 mL of cyclohexane. The density of cyclohexane is 0.779 g/mL. The freezing-point depression was 2.5 °C. Calculate the molar mass of the unknown substance. [ $K_f$  (cyclohexane) = 20.5 °C/m]

$$\text{mass of cyclohexane} = 20.0 \text{ mL} \times 0.779 \frac{\text{g}}{\text{mL}} \times \frac{10^{-3} \text{ kg}}{1 \text{ g}} = 0.01558 \text{ kg}$$

$$\Delta T_f = 2.5^\circ \text{C} = K_f \times m$$
$$2.5^\circ \text{C} = 20.5 \frac{\text{C}^\circ}{\text{molar mass}} \times \frac{0.2436 \text{ g}}{m} \times \frac{10^{-3} \text{ kg}}{0.01558 \text{ kg}}$$

$$\text{molar mass} = \frac{20.5 \frac{\text{C}^\circ}{\text{m}} \times 0.2436 \text{ g}}{2.5^\circ \times 0.01558 \text{ kg}} = 128.2 \text{ g/mol}$$

| Mass of solute ( $m_1$ ) | $0.2 \pm 0.01$ g |            |

$$3.25 = 20.5 \times m$$

$$3.25 = 20.5 \times \frac{0.2}{\text{molar mass}}$$

$$7.79 \times 10^{-3} \text{ kg molar mass}$$

$$\text{molar mass} = 0.2 \times 20.5 = \underline{\underline{-}} =$$

## QUESTIONS:

1. What would be the effect of each of the following on the calculated molar mass of the solute?

- a) Some cyclohexane evaporated while the freezing point of pure cyclohexane was being measured.

..... no effect on the freezing point

..... molar mass of the solute increases  $\Delta T_f = K_f \times \frac{\text{mols solute}}{\text{g of solvent}}$

- b) Some cyclohexane evaporated after the solute was added.

..... no effect decreases

- c) A foreign solute was already present in the cyclohexane.

..... molar mass change

- d) The thermometer is not calibrated correctly. It gives a temperature that is 1.5 °C too low at all temperatures.

..... no effect

## Pre-Laboratory Questions

1. Give the names and symbols of the alkaline earth metals that you will encounter in this experiment.

Magnesium Mg - Calcium Ca - Strontium Sr  
Barium Ba

2. What is the general electron configuration of the alkaline earth Metals and lead?

alkaline earth metals:  $\sim ns^2$   
lead:  $[Xe]_5 6s^2 4f^{14} 5d^{10} 6p^2$

$\left. \begin{array}{l} {}_{12}Mg: [Ne]_1 3s^2 \\ {}_{13}Al: [Ar]_2 3s^2 \\ {}_{38}Sr: [Ar]_8 5s^2 \\ {}_{36}Ba: [Xe]_8 6s^2 \end{array} \right\}$

3. Compare the formulas of the oxides formed by the alkaline earth metals with those of lead.

alkaline earth metals: MO  
lead: PbO<sub>2</sub>

4. Give general formulas for the following compounds with alkaline earth metals or lead:

- (a) A sulfate .....  $M_2SO_4$  .....
- (b) A carbonate .....  $M_2CO_3$  .....
- (c) A chromate .....  $M_2CrO_4$  .....
- (d) An oxalate .....  $M_2C_2O_4$  .....

## Questions:

1. What trends in the solubility's of the compounds of the alkaline earth metals can be concluded?

As the atomic number of the Group IIA metal increase the solubility's may decrease

2. (a) Compare the solubility's of the lead compounds with those of the alkaline earth metals. How are the solubility's similar, and how do they differ?

- (b) As you have seen, lead can form the same kinds of compounds as the alkaline earth metals. Nevertheless, the solubility's may differ markedly. Give a convincing reason.

## Pre-Laboratory Questions

1. Write the mass action expression for these slightly soluble salt equilibria:

$$K_{\text{sp}} = [\text{Cu}^{2+}][\text{S}^{2-}]$$

$$K_{\text{sp}} = [\text{Al}^{3+}]^2 [\text{S}^{2-}]^3$$

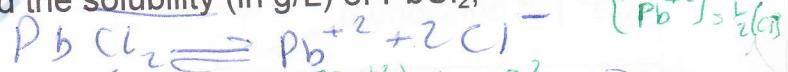

$$K_{\text{sp}} = [\text{Ba}^{2+}][\text{SO}_4^{2-}]$$

2. Calculate the molar solubility and the solubility (in g/L) of  $\text{PbCl}_2$ ,

( $K_{\text{sp}}$  for  $\text{PbCl}_2 = 1.6 \times 10^{-5}$ ).

$$[\text{Pb}^{2+}] = \frac{1}{2}(x)$$

$$[\text{Pb}^{2+}][\text{Cl}^-]^2 = 1.6 \times 10^{-5}$$

$$= (\text{Pb}^{2+})(\frac{3}{2}[\text{Pb}^{2+}])^2$$

$\rightarrow$  molar solubility  $\sqrt[3]{\frac{1.6 \times 10^{-5}}{3}} = 0.117 \text{ mol/L}$

$\rightarrow$  solubility  $= 0.117 \frac{\text{mol}}{\text{L}} \times \frac{158.9}{1 \text{ mol PbCl}_2} = 17.89 \text{ g/L}$

3. Calculate the molar solubility of  $\text{PbCl}_2$  in the presence of 0.10 M NaCl,

( $K_{\text{sp}}$  for  $\text{PbCl}_2 = 1.6 \times 10^{-5}$ ).

$$0.10 \frac{\text{mol}}{\text{L}}$$

$$K_{\text{sp}} = [\text{Pb}^{2+}][\text{Cl}^-]^2$$

$$1.6 \times 10^{-5} = (\text{Pb}^{2+})[0.1]^2$$

$$[\text{Pb}^{2+}] = \frac{1}{2}(x)$$

$x = 0.117 \text{ mol/L} \rightarrow \text{molar solubility} = 0.117 + 0.10$

$$[\text{Pb}^{2+}] = 1.6 \times 10^{-3} \text{ mol/L}$$

$$= 0.217 \text{ mol/L}$$

$$\text{molar solubility} = [\text{Pb}^{2+}] = 1.6 \times 10^{-3} \text{ mol/L}$$

## QUESTIONS:

1. A saturated solution of  $\text{Ca}(\text{OH})_2$  is prepared by adding enough  $\text{Ca}(\text{OH})_{2(s)}$  to distilled pre-boiled water, the solution is then filtered to remove any insoluble amount of  $\text{Ca}(\text{OH})_2$ .

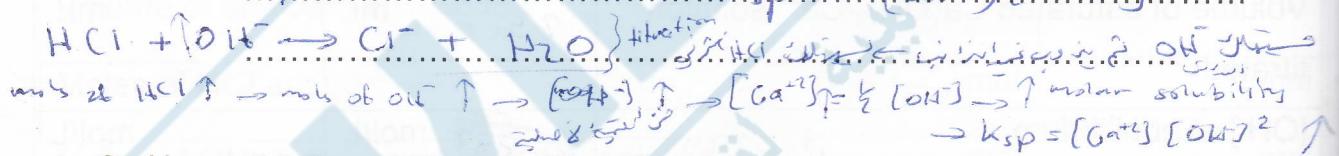

- a) Why pre-boiled water is used to prepare the saturated solution of  $\text{Ca}(\text{OH})_2$ ?

to get rid of gases

- b) If some solid  $\text{Ca}(\text{OH})_2$  remained after filtration, how would it affect the calculated values of molar solubility of  $\text{Ca}(\text{OH})_2$  and the  $K_{\text{sp}}$  for  $\text{Ca}(\text{OH})_2$ ?

↑ increases

$$K_{\text{sp}} = [\text{Ca}^{+2}][\text{OH}^{-}]^2$$

2. How did the added  $\text{CaCl}_2$  affect the molar solubility of  $\text{Ca}(\text{OH})_2$ ?

Explain.

$$K_{\text{sp}} = [\text{Ca}^{+2}][\text{OH}^-]^2$$

decreases

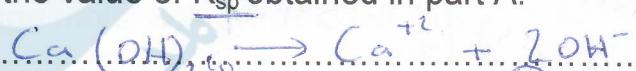

$$[\text{OH}^-] = \frac{K_{\text{sp}}}{[\text{Ca}^{+2}]}$$

$\downarrow \text{molar solubility} = \downarrow [\text{OH}^-] \downarrow$

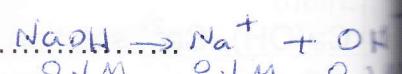

3. Calculate the molar solubility of  $\text{Ca}(\text{OH})_2$  in 0.10 M NaOH solution. Use the value of  $K_{\text{sp}}$  obtained in part A.

$$5.52 \times 10^{-3}$$

$$\rightarrow [\text{Ca}^{+2}] = 0.1$$

$$0.1 \text{M} \quad 0.1 \text{M} \quad 0.1 \text{M}$$

$$K_{\text{sp,p}} = [\text{Ca}^{+2}][\text{OH}^-]^2$$

$$7.44 \times 10^{-5} = [\text{Ca}^{+2}] \times (0.1)^2$$

$$[\text{Ca}^{+2}] = 7.44 \times 10^{-3} \text{ mol/L}$$

$$\text{molar solubility} = 7.44 \times 10^{-3} \text{ mol/L}$$

$$\approx 7.44 \times 10^{-3}$$

$$0.0266$$
